

WHAT IS IT?

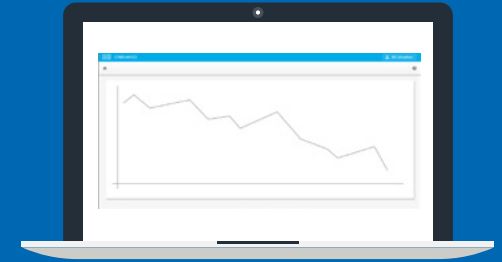

CyberMatics is AIG's award winning technology-driven process that can help an organization:

- Verify its cyber risk posture
- Prioritize implementation of controls that reduce its risk
- Make better investment decisions in its overall cybersecurity program

WHAT ARE THE BENEFITS?

Clients receive their organization's cyber risk scores, recommended actions for improvement, and modeling of recommended actions versus their expected result and cost. All provided through the CyberMatics dashboard in the AIG Cyber Portal.

HOW DOES IT WORK?

CyberMatics clients engage with one of our leading security partners to provide the data from their organization to our cyber underwriting model.

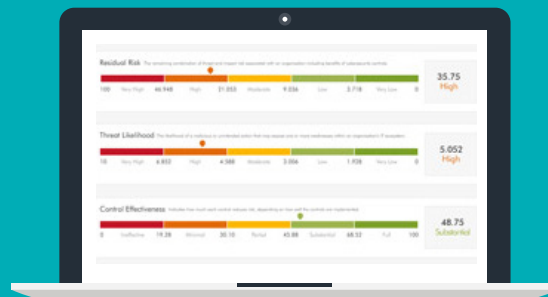

To help ensure privacy, the engaged partner interprets the client's data to provide answers, such as yes or no, in response to specific questions in the AIG cyber application.

AIG does not receive any client system or raw data throughout this process.

We then use that data to regularly update the client's cyber maturity profile throughout the policy period.

Current partners include CrowdStrike® and Darktrace®, with other partners to be available soon.

CISOs can use the forecasting capability to model various changes to controls before implementation and see the effect on their risk score.

Risk managers may benefit from more tailored policy terms and conditions through AIG's assessment of verified underwriting information.

We can help make sure an organization's cybersecurity strategy stays current...and it can get rewarded for it. Contact us today at cyberriskconsulting@aig.com
