

CYBERMATICS®

CyberMatics is AIG's award-winning, patented technology-driven process that can help an organization:

- Verify its cyber risk posture,
- Prioritize implementation of controls that reduce its risk and
- Make better investment decisions in its overall cybersecurity program.

HOW DOES IT WORK?

CyberMatics clients engage with one of our leading security partners to provide the data from their organization to our cyber underwriting model.

To help ensure privacy, the security partner interprets the client's data into answers to specific questions in the AIG cyber application. AIG does not receive any of the client's system or raw data through this process.

We then use that data to regularly update the client's cyber maturity profile throughout their policy period.

Current partners include CrowdStrike®, Darktrace®, TechGuard Security®, Tenable® and ThreatBlockr®, with additional partners to be added soon.

WHAT ARE THE BENEFITS?

Clients receive their organization's cyber risk scores, recommended actions for improvement, and modeling of recommended actions versus their expected result and cost. All provided through the CyberMatics dashboard in the AIG Cyber Portal.

CISOs can use the forecasting capability to model various changes to controls before implementing and see the effect on their risk score.

Risk managers may benefit from more tailored and improved policy terms and conditions through AIG's assessment of verified underwriting information.

**CyberMatics is included with eligible CyberEdge® policies.
